The 21st century may be known as the era of lifelong learning and lifelong working (Longworth 1999). Retirement, the end stage of a linear working life, may be replaced with a learning, working, leisure, working, learning life cycle. In a cyclical living and working model, participating in the work force never ceases but is interspersed with periods of leisure and learning. Full-time work may be interspersed with periods of flexible working arrangements such as part-time, seasonal, occasional, and project work (Brown 1998; Dychtwald 1990). The traditional notion of retirement may be replaced with lifelong working—various positions and in varying amounts of time throughout adult life. In the future a declining birthrate may result in a shortage of skilled and knowledgeable employees (Dychtwald 1990), making the notion of retirement for older workers a serious drain on organizational productivity. Increasing demands for work force productivity, a projected shortage of skilled and experienced workers, and older adults who are healthier and living longer than previous generations are powerful societal forces shaping future employment practices (Imler 1996).

Two decades ago, Sheppard and Rix (1977) forecast the changing nature of the workplace and suggested that keeping older persons in the work force would make sound economic and social policy sense. Yet Ginzberg (1983) raised a most challenging question by asking to what extent is our society ready to make work for an increasing number of older adults who choose to remain in the workplace while also providing opportunities for young adults: if employment is not a possibility, then what is our obligation to provide adequate financial support? Morrison (1990) noted that social policies were needed to encourage and support employers retaining older workers. Today the fastest growing segment of the population is the older adult. Still, the decision to remain or leave the workplace is a function of organizational policy (Eastman 1993). This Digest examines this trend and looks at ways adult educators can create and sustain working environments supportive of the needs and capabilities of older workers.

New Patterns of Work for Older Adults

The trend toward longer periods of employment is beginning to become evident. Forced retirements and early retirement incentives have contributed to the decline of expertise in the workplace. Inflation, increasing health care costs, and inadequate pensions are propelling older adults to remain in or reenter the work force past the traditional retirement age (Doberger 1990; Glied and Stabile 1999; Herz 1995). Stein, Rocco, and Goldenetz (2000) proposed a model that identifies older workers as remaining in, retiring from, or returning to the workplace. These patterns require employers to provide a variety of learning programs to accommodate these older workers. In this model, retirement as a permanent separation from work becomes just a temporary choice.

Retirement as permanent separation from the workplace is being replaced with the idea of bridge employment (Weckerle and Shultz 1999). Bridging is a form of partial retirement in which an older worker alternates periods of disengagement from the workplace with periods of temporary, part-time, occasional, or self-employed work. The key aspect of bridging is that it is work in other than a career job. A career job is a position occupied by a worker for a substantial portion of the working life in a single setting or with a single employer (Doberger 1990). A mong workers age 60, more than 50 percent retire from a career job but only one in nine actually disengages from the workplace (Ruhm 1990; Weckerle and Shultz 1999). Bridging allows older workers to “practice” retirement, to fill labor market shortages, or to try a variety of occupational positions after an initial period of retirement.

Bridging is sometimes described as a second career. The American Association of Retired Persons received 36,000 responses to a working life survey, covering 375 job titles from workers age 50 plus who had returned to the workplace after an initial period of retirement (Bird 1994). The three most frequently cited reasons for returning included having financial need, liking to work, and keeping busy. However, closer examination of the data revealed that “financial need” included money to help the children as well as to meet basic needs. “Liking to work” included feeling successful, enjoying the excitement of the workplace, and making a contribution. “Keeping busy” included working with a spouse, staying healthy, or fulfilling a social need. Reasons cited for remaining or returning to the workplace expressed the social meaning of work. Ginzberg (1983) proposed that work provides income, status, and personal achievement; structures time; and provides opportunities for interpersonal relationships. In the study by Stein, Rocco, and Goldenetz (2000), older workers remaining in or returning to the workplace mentioned not planning wisely, the need to contribute, appreciation from others, and the desire to create something as reasons for not retiring from the workplace. Work is more than earning a living. It is a way to live.

To some extent older workers remain in the workplace because they are healthier, cognitively able, and want to remain engaged. In a review of older worker studies, Rix (1990) concluded that many aging workers continue to work at peak efficiency and that there is usually much more variation within age groups than among age groups. Shea (1991) summarized the studies on older workers by pointing out that “age-related changes in physical ability, cognitive performance, and personality have little effect on workers’ output except in the most physically demanding tasks” (p. 153). Farr, Troluk, and Klein (1998) found that there is no consistent relationship between age and performance across settings. A mong faculty in the sciences, age had a slight negative relationship to publishing productivity (Levin and Stephon 1989). Some studies have shown a stronger negative relationship between age and work performance for nonprofessional and low-level clerical jobs than for higher-level craft, service, and professional jobs (Avolio, Waldman, and Mcdaniel 1990; Waldman and Avolio 1993).

With declining birthrates and an anticipated shortage of new entrants to the work force, early retirement will become an issue for organizations to explore in more detail. Organizations will need to assess the consequences to profits and productivity of encouraging talented and wise elders to exit the work force. A society we need to recognize all of the costs of supporting a nonworking population capable of productive work and living healthier and longer lives.

Organizations need to rethink allocating opportunities to older workers as well as changing the attitudes and expectations of managers and younger employees toward an increasing number of older workers (Greller and Stroh 1995; Hassell and Perrewe 1995; Paul and Townsend 1993). There is a growing interest among organizations to reengineer the work environment to account for physiological changes due to aging (Kupritz 2000) and to reorganize work schedules to account for seasonal or contingent labor pools composed of...
older workers (Canter 1995). Few positions in our information society remain static and do not require some type of education. Education and job redesign are the means by which the older segment of the community can enter, reenter, and advance in the workplace.

**Adult Education Implications**

This inquiry suggests that older workers are situated in a dynamic pattern of periods of active employment, disengagement from the workplace, and reentry into the same or a new career. Older workers exhibit different work patterns at different stages. The workplace becomes a dynamic space for older workers rather than a unidirectional journey leading to retirement. An adult education perspective for the third stage of working life—beyond the traditional retirement age—will view the older worker as an active agent negotiating various roles within the workplace. The roles, depending on life circumstances, might include the decision to remain in, retire from, or return to periods of part-time, full-time, or part-season work. These work choice patterns will challenge adult educators to develop training, career development, and organizational development strategies appropriate to a third stage of working life (Jessup and Greenberg 1989).

An aging and changing work force may cause us to reexamine and revalue the meaning and necessity of work for older workers. A work force that blends training opportunities, flexible employment patterns, and policies supportive of the life needs of an aging work force may become a workplace that embraces older workers as capable, productive, and knowledgeable lifelong workers. Older workers will need organizational and social supports to encourage the extension of the work life (Bailey and Hansson 1995).

An investigation of the meaning of work in the lives of older workers is fertile ground for adult educators. Adult educators might explore learning-teaching approaches that are more effective for promoting the meaning and necessity of work. An adult education perspective for the third stage of working life—beyond the traditional retirement age—will view the older worker as an active agent negotiating various roles within the workplace. The roles, depending on life circumstances, might include the decision to remain in, retire from, or return to periods of part-time, full-time, or part-season work. These work choice patterns will challenge adult educators to develop training, career development, and organizational development strategies appropriate to a third stage of working life (Jessup and Greenberg 1989).

Older workers represent a rich source of experience, accumulated knowledge, and wisdom. The quality and sensitivity of an institution’s program for counseling, training, retraining, and preparing older workers for life and career transition might be the means by which organizations recruit and retain valued and productive workers.
